Portotherm

A clearer starting point

Prioritize buildings for investigation using existing monthly heat consumption data.

The customer hypothesis

Professional apartment managers in Latvia, initially portfolios of 20-100 buildings. Buyer demand and time savings remain unvalidated.

The workflow

Import and validate CSV/XLSX. The engine computes the weather reference. Optional Claude suggests column mapping, evidence-backed explanations and investigation task drafts. A person reviews and explicitly approves tasks.

A reviewable local demonstration

12 synthetic buildings, 33 months, 11 usable references and 1 investigation priority. Synthetic demo data - not measured customer results. The same engine drives screens and reports. Claude requires backend configuration and approved data transfer; live API verification is pending.

The proposed pilot

5-10 buildings, six weeks of retrospective review. Deliver a quality report, explained findings, expert decisions and a continuation recommendation. Agree usability and review metrics together.

The next step

Seek manager introductions, a local energy reviewer and guidance on a suitable advisory/support route. Founder profile, legal setup, real weather input, identity configuration and hosting still need confirmation.

Limits

Monthly analysis, human review. No equipment control, certified audit, fault diagnosis, guaranteed savings, LIAA acceptance or funding approval claimed.
